Dear FDA:

Aluminum salts in antiperspirants have been identified by scientists as a cause of breast cancer. Some scientists now consider it to be the leading cause of breast cancer.

Aluminum is a known neurotoxin and is a carcinogen. Warning labels should be placed on antiperspirants containing aluminum salts and compounds.

The research is published on Cancer Corner USA and confirms the association of aluminum and breast cancer.

Women of the world need to be aware of the danger to their health in using these products.

Thank You,
